## How to repair GRUB with a live cd?

There are many things that could go wrong with a GRUB installation and one way to get the system booting is some kind of a live cd. sysrescuecd is highly recommended as it has a ton of options for fixing a broken installation.

The main problem I had was getting GRUB to recognize the drives etc. correctly, when you boot from a live cd. There are a few things you need to keep in mind, so you can repair GRUB and other things in the first place:

1) mount the system into the live cd environment:

```
mkdir /mnt/system  
mount /dev/sdX /mnt/system
```

2) mount the proc and other special file system so your system will work properly:

```
mount -o bind /dev /mnt/system/dev  
mount -o bind /sys /mnt/system/sys  
mount -t proc /proc /mnt/system/proc  
cp /proc/mounts /mnt/system/etc/mtab
```

3) after that is all done, you can chroot into the system and work with it and make repairs:

```
chroot /mnt/system /bin/bash
```

From there you can make your way with update-grub and of course grub-install /dev/sdX --recheck
