Linux

How to skip or bypass fsck on reboot / system startup?

There are a few ways to make this happen, the simplest way is to reboot the machine with this command:

```
shutdown -rf now
```

Specifically for Debian you can also do this:

```
touch /fastboot
```

The bit more complicated way is to add fastboot as kernel parameter. This can be either done by editing it live when the server boots up or by changing your grub config /boot/grub/grub.conf. Search for menuentry and look for the part "linux" and add fastboot like in this example:

```
linux /boot/vmlinuz-2.6.32-5-amd64 root=UUID=6ba7e075-d8cf-4839-xxxx ro quiet fastboot
```
