Daemon

What are the valid POP commands?

If you look deeper into this matter we recommand you to take a look into the RFC1460:

ftp://ftp.rfc-editor.org/in-notes/rfc1460.txt

Here ist the listing of the POP commands which you can use debugging purposes for example:

- **stat**: return basic staticts about the mailbox store
- **list**: outputs a list of available message in the mailbox store
- **retr**: returns the message body for the given message id
- **dele**: delete the given message id
- **last**: returns the message id of the highest id that has been touched within the session
- **noop**: no operation
- **rset:** removes the deletion mark for all emails in the mailbox store
- **quit**: close connection and after that is done, update the mailbox store
