

# Daemon

## How to install Tomcat5.5 in Debian Lenny?

here are a few hints to get you started:

- you need to change your `/etc/apt/sources.list` so it does include the non-free repository, so it will look like that:

```
deb http://ftp.at.debian.org/debian/ lenny main non-free contrib
deb http://security.debian.org/ lenny/updates main non-free contrib
```

- now run:

```
aptitude update;
aptitude install sun-java6-jre sun-java6-jdk
```

for production systems you might want to use Java 5 JRE instead:

```
aptitude install sun-java5-jre sun-java5-jdk
```

- now you need to tell your system, that you want to use the just installed JRE version:

```
update-alternatives --config java
update-alternatives --config javac
```

- check if it has worked out:

```
java -version
javac -version
```

- now you need to add `JAVA_HOME` to your bash environment:  
edit `/etc/bash.bashrc` and add:

```
export JAVA_HOME=/usr/lib/jvm/java-6-sun/
```

or if you installed Java 5 JRE:

```
export JAVA_HOME=/usr/lib/jvm/java-5-sun/
```

- log out and login to your system again, or run the relevant above command
- `apt-get install tomcat5.5 tomcat5.5-admin tomcat5.5-webapps`
- you can try if Tomcat is working, by connecting from your server to `http://localhost:8180`  
the login credentials are stored here: `$TOMCAT_HOME/etc/tomcat-users.xml`

enjoy!
