

# Postfix

## How to bind postfix to an IP / interface?

Also a pretty basic thing, here you are:

Edit the main.cf with your favorite editor, for me that is vi and on Debian the file path goes like that:

```
vi /etc/postfix/main.cf
```

Look for: inet\_interfaces

To bind postfix to all interaces, use:

```
inet_interfaces = all
```

For a single or multiple addresses do this:

```
inet_interfaces = 77.74.55.1,127.0.0.1
```

After changing config, restart postfix and use netstat -lpn to see if the change was successful.
