

git

How to fix error: RPC failed; result=56, HTTP code = 0?

This happened to me when pushing bigger changes to my git server. The usual size is 2MB, so what I did is just set the limit to 2MB and it ran through fine:

```
git config --global http.postBuffer 2M
```

Here some additional technical information:

```
http.postBuffer
```

Maximum size in bytes of the buffer used by smart HTTP transports

when POSTing data to the remote system. For requests larger than

this buffer size, HTTP/1.1 and Transfer-Encoding: chunked is used

to avoid creating a massive pack file locally. Default is 1 MiB,

which is sufficient for most requests.
